

I have often had to work with scientists and other Ph.D. learning complex wiring for repairs, porosity and density, aqueous measurements, and fluorescence. Question: who doesn't love fluorescence?

In the following, capacitor 47uF (under DIM) would often fail to require a simple soldier to repair this \$485 fluorescence lamp. It seemed power surges were responsible but not validated. ~brian

Northern Paper Wasp (*Polistes fuscatus*) fluorescing under blue excitation light
